

my talk: a nice talk

December 11, 2015

A chapter

my talk: a
nice talk

slides

`present-tex` converts a `.slide` presentation to a LaTeX/Beamer presentation.

Here are some bullets:

- correctly rendered
- but not numbered

Consider this simple package github.com/me/hello:

```
package main

import (
    "fmt"
)

func main() {
    fmt.Printf("hello world\n")
}
```

present-tex and play

my talk: a
nice talk

slides

present-tex has some limited supported for .play:

```
package main

import (
    "fmt"
)

func main() {
    fmt.Printf("hello world\n")
}
```

Images are supported, such as this lovely PNG gopher:

or that lovely gopher:

present-tex and text formatting

my talk: a
nice talk

slides

present-tex should be able to correctly handle URLs like [so](#).

But, also, **bold** text and text in *italics*.

Special LaTeX characters, such as $\&\{\}\backslash\$%^_{\#}$, are also correctly handled.

[github.com/sbinet/present-tex](#)

Snippets of code look like so:

```
$> ls /my/dir
```

```
$> exit
```

[github.com/sbinet/present-tex](#) is still a *work in progress*.

The END.
